
[Validation Protocol](#)

The validation protocol is a comprehensive test guideline and checklist for validating the FCC Online functionality. It covers all functional requirements and explores their behavior under various configurations of supported software.

The validation protocol provides assurance that the system has a high level of data integrity and accuracy, and enables the validation personnel to record all details needed to demonstrate the system is functioning properly.

You can choose to open the validation protocol as either a PDF (requires Acrobat Reader) or an Excel spread sheet file.
